TITLE: A Study of the Dependence of Microhardness on Loading in Single Crystals of NaCl

PERIODICAL: Kristallografiya, 1959, Vol 4, Nr 4, pp 597-602 + 1 plate (USSR)

ABSTRACT: The microhardness of natural NaCl crystal, freshly cleaved and artificially coloured, was measured with a PMT-3 microhardness tester as a function of load. Loads up to 100 g were used. Up to 12<sup>2</sup>g the hardness increased steadily from 20 to 24 kg/mm<sup>2</sup> but by 25 g the hardness has returned to about 21 kg/mm<sup>2</sup>. Crystals uncoloured, those coloured in various ways and those decolourised behave in substantially the same way. The reaction pressure of the imprint mark for an elastic crystal is treated theoretically and experimentally. The elastic reaction of impressions is shown to be a small effect and shows no influence on the measurement of the microhardness. This reaction also has no

Card1/2

SOV/70-4-22/34

A Study of the Dependence of Microhardness on Loading in Single Crystals of NaCl

influence on the anisotropy of the formation of the imprints on the (100) faces of NaCl. Near the edges of the imprints bulging and denting of the material is found, which does have a substantial influence on the measurement of the microhardness. There are 7 figures, 1 table and 13 references, of which 11 are Soviet and 2 German.

TITLE: The Secondary Emission of Films of the Cu-Sb System

PERIODICAL: Uch. zap. Kishinevsk. un-t, 1959, Vol. 39, pp. 79-83

TEXT: Films of Cu-Sb alloys were obtained by the joint evaporation of the components with deposition on a glass base layer. In this case the stoichiometric compound Cu<sub>2</sub>Sb was formed in the central part of the film. The secondary emission of Cu<sub>2</sub>Sb does not depend on the temperature and the thickness of the film. The maximum coefficient of secondary emission ( $\delta = 2.2$ ) is attained at high energies of the primary electrons (500-600 ev), which fact approximates Cu<sub>2</sub>Sb to semiconductors. An excess of Cu or Sb in the Cu<sub>2</sub>Sb compound decreases  $\delta$ . In the case of an increase in the Cu excess a smoother decrease of  $\delta$  is observed than with an increase in the Sb excess. This points to the low solubility of Sb in Cu<sub>2</sub>Sb. X

TITLE: Study of the Effects of Some Factors on the Hardness  
of KCl and NaCl Single Crystals

PERIODICAL: Kristallografiya, 1960, Vol 5, Nr 1, pp 98-104 (USSR)

ABSTRACT: Numerous experiments by various authors are cited. Some  
of them produced contradictory results and made  
further studies necessary. The (100) faces of two  
sets of KCl crystals were etched for different periods  
with water and tested for the indentation and scratching  
hardnesses. Both values at first increased with du-  
ration of etching for 2-3 min but dropped again to  
usual values on still further etching. Polishing of  
(100) faces in saturated KCl solution on a cloth also  
increased the hardness with time duration for the  
first 2 min and reduced again on still further duration.  
However, no hardness increase was evident when spec-  
mens were polished with iron oxide instead of KCl

solution. Thus, impregnation of the surface layer with water is believed to be the principal reason for the hardness increase. The reason for its drop with further treatment may be related to the healing of dislocations because of the intermediary action of the impregnating water. The healing as such increases and stabilizes the surface hardness but at the same time eliminates the internal stresses around former dislocations and, consequently, the additional hardness caused by these stresses. To check this concept the authors tested NaCl crystals which a priori had different degrees of structure distortions and obviously required different periods for the healing of their defects. The structure distortions, produced by a repeated alternation of coloring and bleaching procedures, proved to alter the surface hardness of crystals to such a small extent that the hardness changes during the experiments remained within the limits of possible errors. However, longer periods of etching to achieve the maximum surface hardness of more

TITLE:

Convective heat loss of plane units of solar installations

PERIODICAL:

Referativnyy zhurnal, Mekhanika, no. 2, 1963, 74,  
abstract 2B472 (Izv. AN MoldSSR, 1961, no. 11(89),  
25-36 (summary in Mold.))

TEXT:

Heat loss of plane surfaces in transversal flow was investigated experimentally, in wind tunnels with cross-sections of 600 x 600 mm and 250 x 250 mm. Four discs with diameters of 300, 150, 100 and 50 mm and a square plate with side measurement of 200 mm, all made of copper, 9 - 11 mm thick, were investigated. The exposed polished surface was maintained at a constant temperature. The velocity of flow was measured by thermoanemometers, wing anemometers and Prandtl tubes; temperature was measured by mercury thermometers and copper-constantan thermocouples. Results (with an accuracy of up to 4%) for  $R$  between  $2.5 \times 10^3$  and  $10^5$ , flow velocity

Card 1/2

Convective heat loss ...

between 1 and 40 m/sec and temperature of surfaces exposed to the flow up to 350°C, are described by the formula

$$N = 1.41 R^{0.475}$$

Here  $N$  - Nusselt's number,  $R$  = Reynolds' number. The results are referred to the mean temperature of the boundary layer  $t_m = 0.5(t_w + t_f)$ , where  $t_w$  and  $t_f$  are the temperature of the wall and the flowing liquid. The radius of the disk (of the equivalent disk in the case of the plate) is taken as the characteristic dimension. Good agreement exists between experimental results and previously obtained theoretical results (V.A. Baum, M.K. Bologa, P.M. Brdlik. Inzh.-fiz. zh., 1961, v. 4, no. 6, 13-20-RZhMekh. 1962, 2B582). The results are compared with data obtained by other authors.

TITLE: Heat transfer in the case of a transverse flow around plane surfaces

PERIODICAL: Inzhenerno-fizicheskiy zhurnal, v. 4, no. 6, 1961, 13-20

TEXT: This paper deals with the theoretical and experimental research of heat transfer in vertical plane surfaces. The experimental data agreed well with those obtained theoretically. The heat exchange on plane surfaces surrounded by an air current is of great practical interest since it determines the reliability and life of many technical products. So far, this type of heat exchange has hardly been investigated. Two experiments are known, which treat several points of this problem. The paper of Jakob, which is mentioned in the literature, deals with the case of a plane surface surrounded by an air current. Summarizing, the following can be said: 1) The tests were done on small surfaces and the local heat transfer coefficients had not been determined. 2) The theoretical investigations dealt with the frontal point and its surroundings. It is

Card 1/4

23747

Heat transfer in the case of ...

S/170/61/004/006/001/015  
B129/B212

still uncertain whether this solution is valid for the whole surface. The present paper aims at determining this and at investigating the heat transfer in transverse flows around plane surfaces, determining the effect of the dimensions on the mean heat transfer coefficient, and an analysis of the local heat transfer coefficients and their distribution on the surface of the heat exchange. An attempt has also been made by the authors to solve the problem analytically for a plane disk. The theoretical considerations start from the energy equation

$$W_r \frac{\partial t}{\partial r} + W_z \frac{\partial t}{\partial z} = a \left( \frac{\partial^2 t}{\partial r^2} + \frac{1}{r} \frac{\partial t}{\partial r} \right) + a \frac{\partial^2 t}{\partial z^2} \quad (1)$$

(the dissipation function and terms which are pressure dependent have been neglected). Assuming incompressibility of the liquid and neglecting the heat conduction along  $r$  the simplified energy equation  $W_z dt/dz = ad^2 t/dz^2$  is obtained. This equation is solved by employing reduced parameters. The solution shows that the local heat transfer coefficient will not be a function of the disk radius, i.e., it is constant for the whole disk.

B129/B212

Heat transfer in the case of ...

Fig. 1 shows the experimental arrangement which was used for checking the theoretical results. The temperature of the disk surface had been varied from 50-350°C. The air channel having a cross section of 600 · 600 mm furnished an air flow of from 1-17 m/sec (the one having a cross section of 250 · 250 mm showed velocities up to 40 m/sec). The temperature fields on the boundary layer, which were used to determine the distribution of the local heat transfer coefficients along the diameter of the disk, had been measured by changing the location of the thermocouples. The experiment showed that the mean heat transfer coefficients for the whole disk agree with the mean values of the local heat transfer coefficients. These had been found according to the temperature distribution along the boundary layer. It was also found that for  $N_{Re} = \text{const.}$  (abstracter's note:

$N_{Re}$  is not defined) the local heat transfer coefficients are practically constant for the whole surface. V. P. Motulevich and G. Shlikhting are mentioned. There are 4 figures and 10 references: 6 Soviet-bloc and 4 non-Soviet-bloc. The most important reference to English-language publication reads as follows: Jakob M., Proc. Phys. Soc., 59, 335, 726, 1947.

PERIODICAL: Tr. Nauchno-tekhn. soveshchaniya po proyektir. i str-vu teplovykh setey. M.-L., Gosenergoizdat, 1956, pp 168-170

ABSTRACT: In 1953, Lengazset'stroy worked out a project for building heat-supply networks; the blueprints included network schematic diagrams, organizational plans, and an annual work schedule. Advantages and disadvantages of this project are noted. A description is offered of construction and erection work and of labor-organizing methods.

Spectrograms of VV Ori were obtained by Dombrovskiy in Abastuman (September-October 1938) with a Zeiss camera and an objective prism. The results of measurements were corrected for absorption of light by the terrestrial atmosphere. Elements of the circular eclipse were calculated using photoelectric observations of H. Schneller (Kl. Veroeff., Berlin-Babelsberg, No 17 (1936)). The effective temperature of the satellite was found to be 12,100° and of the main star 22,000°. (RZhAstr, No 11, 1954)

TITLE: The Absolute Spectrophotometry of the Lower Chromosphere

PERIODICAL: Izv. Gl. astron. observ. v Pulkove, 1958, Vol 21, Nr 3, pp 24-28 (résumé Engl.)

ABSTRACT: The total radiation of 138 weak spectral lines was determined from three spectrograms recorded during the total solar eclipse in 1952 by V.P. Vyanitsyn through a method developed by him. Tables are shown of the logarithm values of the total E radiation of the chromospheric radial band, 1 cm in width and lying above the h level (in a unit solid angle) for various spectral lines. E is given for several values of h (up to 5 for some lines). Values are obtained for 40 lines of the gradient of emission  $\beta^3$  and the coefficient A, contained in the formula  $E = Ae^{-\beta^3 h}$ . The spectral lines are identified by correlating the spectrograms with Mitchell's catalogue of chromospheric lines. (Mitchell S.A., Astrophys. J., 1947, Vol 105, Nr 1).

TITLE: Thermo-oxidative degradation of polyphenylpolydimethylsiloxanes

SOURCE: Plasticheskiye massy\*, no. 2, 1964, 22-25

TOPIC TAGS: polyphenylpolydimethylsiloxane, oxidation stability,  
thermo oxidative degradation, weight loss, bonding ability, poly-  
organosiloxane, Arrhenius equation

ABSTRACT: The oxidation stability of the films of two polyorgano-  
siloxanes was studied in the 300-500°C range by determining weight  
loss and bonding ability over a period of up to 90 days. Figures 1  
and 2 summarize the data obtained at 300, 350, 400, and 500°C. Life-  
time curves (figures 3 & 4) for the polymers were constructed based  
on these parameters. From these curves it is seen that although the  
bonding ability of the 2 polymers differs at the lower weight loss  
levels, it reaches agreement when the weight losses are stabilized  
(at 27, 30%). Calculations were made assuming the rate of aging (i.e.,

card 1/5 2

L 39928-65

ACCESSION NR: AP4012186

the change in polymer properties on aging), followed the Arrhenius equation:  $\alpha_t = A e^{-E/RT}$  using E, the activation energy, as 32 kcal./mole.

Calculations are in excellent agreement with experimental data.  
Orig. art. has: 12 figures, 1 table and 1 equation.

Fermentation of wood hydrolysates by thermophilic yeast. M. Ya. Kalyuzhnij, I. S. Loginova, S. N. Ostapin, G. V. Bolendz, I. A. Selivanova, and Z. T. Ivanova, *Vestn. Inst. Mikrobiol., Akad. Nauk S.S.R.*, 3, 73-89 (1951). Expts. with a thermophilic strain of *Saccharomyces cerevisiae* showed that at 35° the yield of EtOH does not fall behind that attained at conventional 30°. In the development of this strain in wood hydrolysate at an elevated temp, the actual growth of the organism is retarded in comparison with controls. The cultures must be made acclimated to the medium by residence in it for about 2 weeks prior to the test. G. M. Koslapoff

CH(5)

Bolondz - G.V.

A continuous method of fermentation of hydrolyzed wood.  
K. P. Andreev and G. V. Bolondz. *Gidroliz*, i Lerekhin.  
*Prom.* 8, No. 7, 5-7(1955).—A continuous fermentation  
process is described. For this purpose 2 new genera of  
branched-type yeast were cultivated (Av-1 and Lv-4),  
and their multiplication const. ( $k$ ) was detd. The rate of  
feed of the fermentation liquor (I) is given by the equation:  
 $y$  (cu.m./hr./cu.m. of tank vol.)  $\approx kx/ac$ , where  $x$  is the  
concn. of the yeast in I in kg./cu. m.,  $a$  is the increase of  
the fermentation mass in kg./kg. of the fermented sugar  
(II), and  $c$  is the amt. of II in kg./cu. m. The app. consists  
of a preheater, 2 fermentation tanks in series, and a conical  
settler from which the sediment is returned to the 1st fer-  
mentation tank. Characteristic for the above yeasts is  
that they grow very rapidly, sorb colored bodies from the  
fermentation mass, and settle quickly. T. Jurecic

39. Possibilities for the improvement of swing-hammer mills (In Russian) - I. Böldni (*Acta Technica Academiae Scientiarum Hungaricae*, Vol. 10, 1955, No. 3-4, pp. 355-396, 31 figs., 3 tabs.)

According to Kolmogorov's theory it can be accepted as proved that the distribution of particles produced by the size reduction of inhomogeneous materials is logarithmically normal as a function of particle size. Distribution is determined by two parameters established by means of screening tests. If the parameters are known the factors depending on distribution — e. g. specific surface — are easily computable. Swing-hammer mills, operating at present at a peripheral velocity of 6.3 m per sec., can satisfy only to a slight degree the needs of animal husbandry since the particle size of the product — which depends to a great extent on the peripheral velocity of the hammers — does not meet the required fineness. Increases in the peripheral velocity of the hammers entail higher (nonlinear) increases in power requirements and specific power consumption whereas output and fineness of discharge are only linearly increased. In size reduction the amount of power required for producing a unit area of new surface can be regarded in practice as independent of the peripheral velocity of the hammers since the increase of specific power consumption (kwh per unit weight of product) due to increased peripheral velocity is balanced by the simultaneous increase in particle size. In other words, when using the same mill, a 30 to 40% higher quantity of products can be obtained by the use of an e. g. 3 mm dia mesh screen at the same specific cost (kwh per unit area of fresh surface) even if a higher total of energy is consumed.
